Site Visit Photos

Photo 1 **Site 1a. Looking downstream at the sinuous channel with bare banks with undercutting at station 1+50.**

Photo 2: **Site 1a. Looking downstream at station 2+75. The left bank is bare at a vertical angle, while the right bank is angled and has a soil material change at the bottom foot of the bank.**

Photo 3: **Site 1b. Looking downstream at sediment build up on left bank and bare right bank at station 4+60**

Photo 4: **Site 1b. Looking downstream at station 5+00, both banks have tree roots present.**

Photo 5: **Site 1c. Looking downstream at station 6+40, slight undercut for left bank and slumping on the right bank.**

Photo 6: **Site 1d. Looking downstream at the straight channel segment at station 7+20.**

Photo 7: **Site 1d. Looking downstream at station 7+75, the right bank is eroding due to a sharp turn and could encroach on the trail.**

Photo 8: **Site 1e. Looking downstream at station 9+25, the left bank is angled and bare while the right bank is vertical with spotty plant coverage.**

Photo 9: **Site 1f. The creek begins to become more sinuous at station 11+40 and the left bank has undercut.**

Photo 10: **Site 1f. Looking downstream at station 12+50, low bank on left side, higher bank on right side, plant cover is intermittent.**

Photo 11: Site 1g. Looking downstream at station 14+00, both banks are low with some undercutting.

Photo 12: Site 1g. Looking downstream at station 15+10, multiple outlets enter this location and could contribute to the eroding banks.

Photo 13: Site 1h. Looking downstream at station 16+00, upstream of a large pool that is at least 6 feet deep.

Photo 14: Site 1h. Looking downstream at station 16+80, the channel becomes sinuous and sediment deposition has occurred on the right bank.

Photo 15: Site 2a. Looking downstream at station 19+20, this location is downstream of an outlet; flows with high exit velocities are eroding the left bank.

Photo 16: Site 2a. Looking downstream at station 20+30, the right bank is bare and vertical. There are two footbridges in this vicinity.

Photo 17: Site 2b. Looking downstream at station at 22+00, there is a buildup of sediment in the channel that is approximately 40 feet by 100 feet in area.

Photo 18: Site 2b. Looking upstream at 23+20. Roughly 40% of the channel width is filled in. Most of the sediment buildup is 1 foot above the water surface level, with a few locations reaching 2 feet higher than the water surface.

Photo 19: Site 2c. Looking downstream at station 23+50 from the pedestrian trail.

Photo 20: Site 2c. Looking downstream at station 24+80 with steep eroding banks and woody debris in the channel.

Photo 21: Site 2d. Looking upstream at station 26+50, both banks are angled at approximately 60 degrees and are bare.

Photo 22: Site 2d. Looking at the right bank at station 27+90, the bank is mostly exposed.

Photo 23: Site 2e. Looking downstream at station 30+30, the right bank is bare while the left bank had moderate cover.

Photo 24: Site 2e. Looking downstream at station 31+10, woody debris has fallen into the channel and there is slight sediment accumulation at the bottom of the banks.

Photo 25: Site 2f. Looking downstream at station 34+40, multiple fallen trees in the channel creating woody debris and potential channel blockages.

Photo 26: **Site 3a. Looking downstream at the sediment island formed at station 37+00 due to the pipe crossing at Vicksburg Road. The island width ranges from 1 to 10 feet wide, is 30-feet long, and roughly 1 foot above the water surface level.**

Photo 27: **Site 3c. Looking downstream at station 42+90, both banks have minimal vegetative surface protection.**

Photo 28: Site 3c. Looking downstream at a bend at station 45+20.

Photo 29: Site 3d. Looking downstream at station 46+70 where the channel widens.

Photo 30: Site 3d. Looking downstream at station 47+50, the channel has bare banks and minor meandering and good floodplain connection.

Photo 31: Site 4a. Looking downstream at station 54+00, downstream of the Rockford Road crossing. Undercut bank (six inches or less).

Photo 32: Site 4a. Looking downstream at station 55+00, both banks have slight undercutting at the water line.

Photo 33: Site 4b. Looking downstream at station 57+00, the banks are vertical and bare.

Photo 34: Site 4b. Looking downstream at station 57+80, woody debris has fallen into the channel.

Photo 35: Site 4c. Looking downstream at station 59+00, the right bank is undercut below the tree roots.

Photo 36: Site 4c. Looking downstream at station 60+00, the left bank is undercut.

Photo 37: Site 4d. Looking downstream at station 62+30, sediment accumulation on the right bank.

Photo 38: Site 4e. Looking downstream at station 63+00, mild channel blockage.

Photo 39: Site 4e. Looking downstream at station 64+20, upstream of a larger deep pool.

Photo 40: Site 4f. Looking downstream at station 65+60, the banks are bare but have good floodplain connection

Photo 41: Site 4f. Looking downstream at station 66+90 towards the 38th Avenue crossing. The center and right culvert are partially blocked by sediment deposition.

Photo 42: Site 4g. Looking upstream at station 69+00 towards the 38th Avenue crossing. Slight sediment build up in center of channel near the culverts.

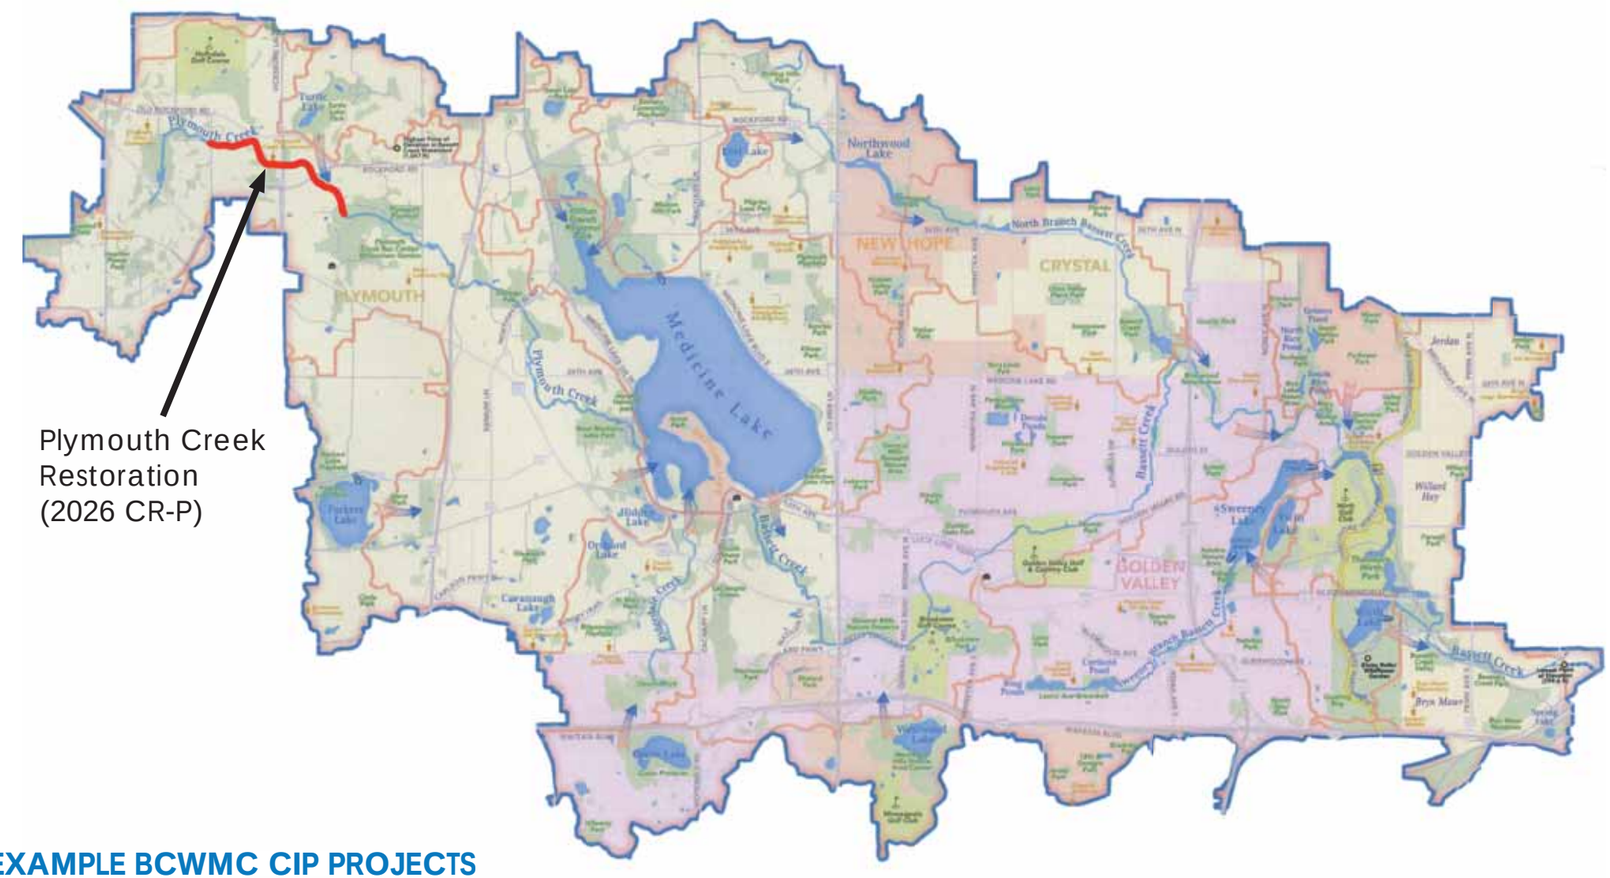
About the Bassett Creek Watershed Management Commission (BCWMC)

The vision: stewardship of water resources to protect and enhance our communities



About the BCWMC

- **Regional government organization** formed in 1969 to focus on flood control along Bassett Creek
- **Operates under a 10-year management plan**
- **Focused on providing flood management and improving and protecting the water quality** of Bassett Creek and lakes/streams
- **Nine member cities:** Crystal, Golden Valley, Medicine Lake, Minneapolis, Minnetonka, New Hope, Plymouth, Robbinsdale, St. Louis Park,
- **Area:** approximately 40 square miles

Commission funding

- Contributions from nine member cities (approximately $600,000 per year)
- Hennepin County tax levy for major projects (approximately $1.5–2 million per year)
- Grant funds and application fees (varies)

Commission activities

- Implements capital improvement projects that reduce flooding and improve lakes, streams, and wetlands throughout the watershed
- Monitors water quality, performs studies, maps resources
- Provides water resource education and watershed-wide coordination
- Reviews developments for compliance with standards and requirements

0 500 Feet

Restoration Prioritization Factors

Several factors will impact prioritization of Plymouth Creek restoration locations, including:

- Severity of existing erosion
- Public access/ownership
- Protection of existing structures/infrastructure
- Impact to surrounding areas
- Public visibility/accessibility
- Potential for future erosion (near-bank stress and bank erosion hazard index ratings)
- Opportunity for habitat creation or restoration
- Maintaining healthy, native significant trees (minimize removal)
- Vegetation establishment potential (exposure to sunlight)
- Ease of construction access
- Consideration of proximity/possibility for other improvements (e.g. new sediment trapping device in nearby storm drains)
- Potential for public education/ signage

Any type of erosion comes with the associated issues:

- Introduction of sediment to stream and downstream waterbodies
- Degradation of bank vegetation and reduced potential for re-growth
- Degradation of in-stream and bank habitats
- Increased risk of continued erosion
- Changed stream shape and size over time

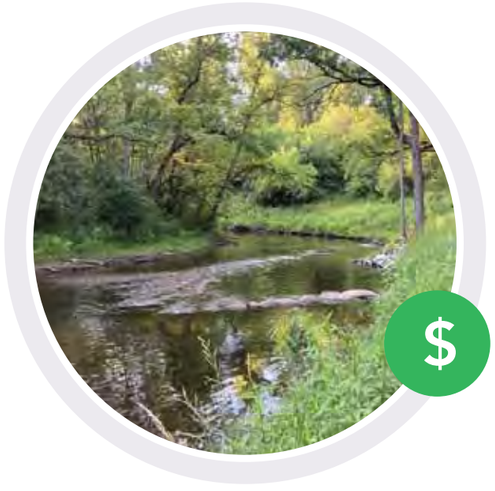
City of Plymouth

Bassett Creek Watershed Management Commission

Plymouth Creek Restoration Project

Stream Stabilization Methods

1



In-stream structures

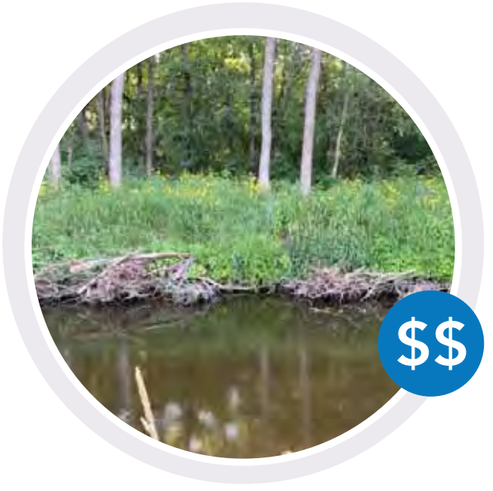
Pros

- Reduces near-bank stress
- Minimal bank disturbance
- Lowest construction cost
- Diversifies flow within stream, including energy dissipation pools
- Provides in-stream habitat

Cons

- In-stream features can be obstructed with sediment and debris
- Continued erosion on unprotected bank toe outside the zone of influence of the structures

2



Bank stabilization with bioengineering methods

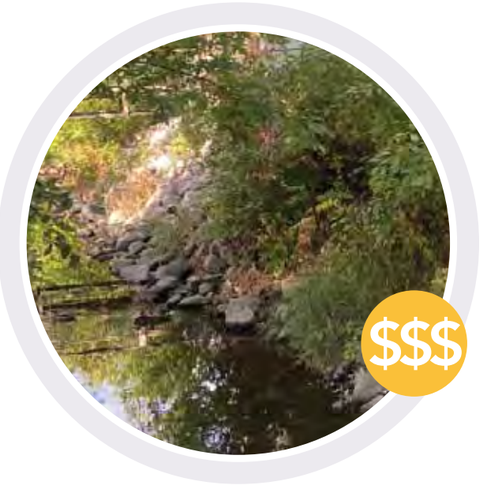
Pros

- More erosion protection along the base of the bank, also known as the bank toe
- Bioengineering and vegetation features can improve in-stream and bank habitat

Cons

- Requires establishment period for vegetation features
- Moderate grading can increase construction costs, bank disturbance, and potential tree removal

3



Bank grading with riprap and vegetation establishment

Pros

- Riprap allows for the most protection against damaging (high shear stress) flows
- Immediate stabilization of eroding areas

Cons

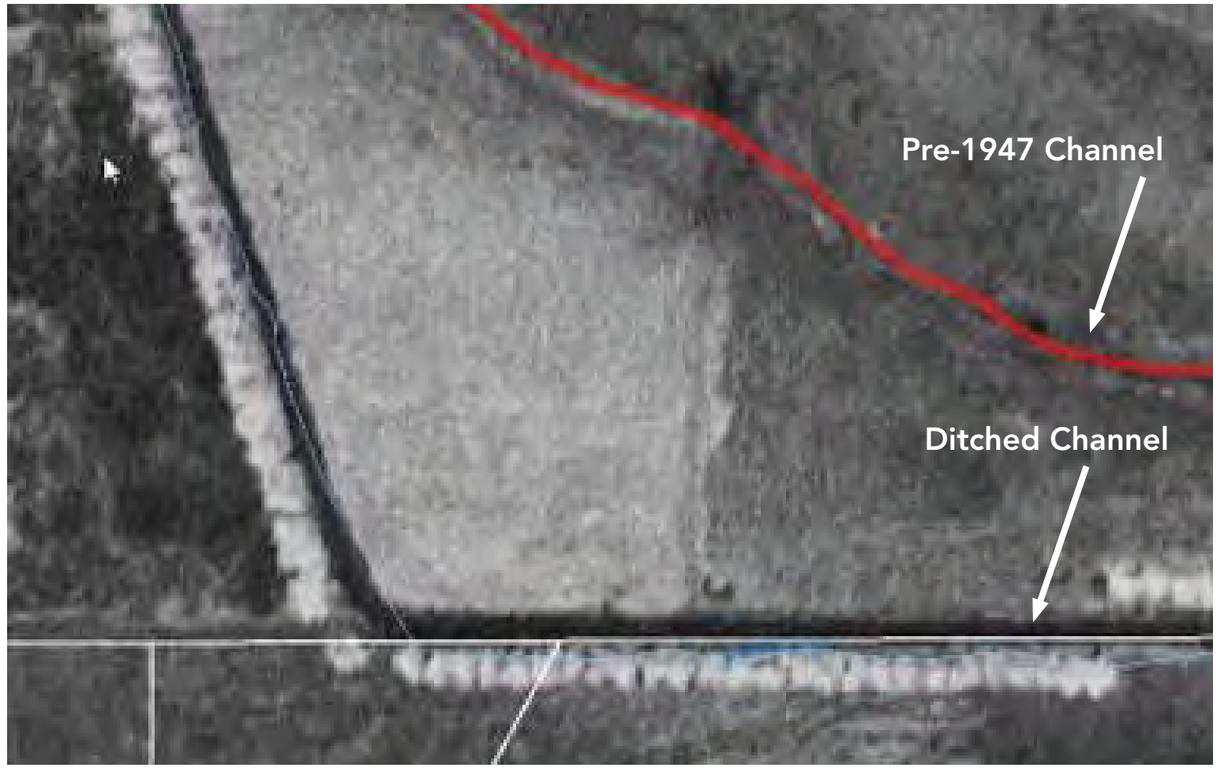
- Riprap provides minimal in-stream or bank habitat
- Riprap and grading are more cost intensive
- Most bank disturbance during construction, and potential tree removal

Potential Re-meandering

In 1947, Plymouth Creek was ditched and straightened, possibly to improve access to agricultural fields. It is likely that even the pre-1947 channel had been altered from the original stream flowpath. Natural channels are typically sinuous, and re-establishing a meandering pattern can be an important part of restoring a ditched and straightened stream. Creek re-meandering is one restoration option under consideration for the portion of the creek that is west and south of Plymouth Creek Elementary School.

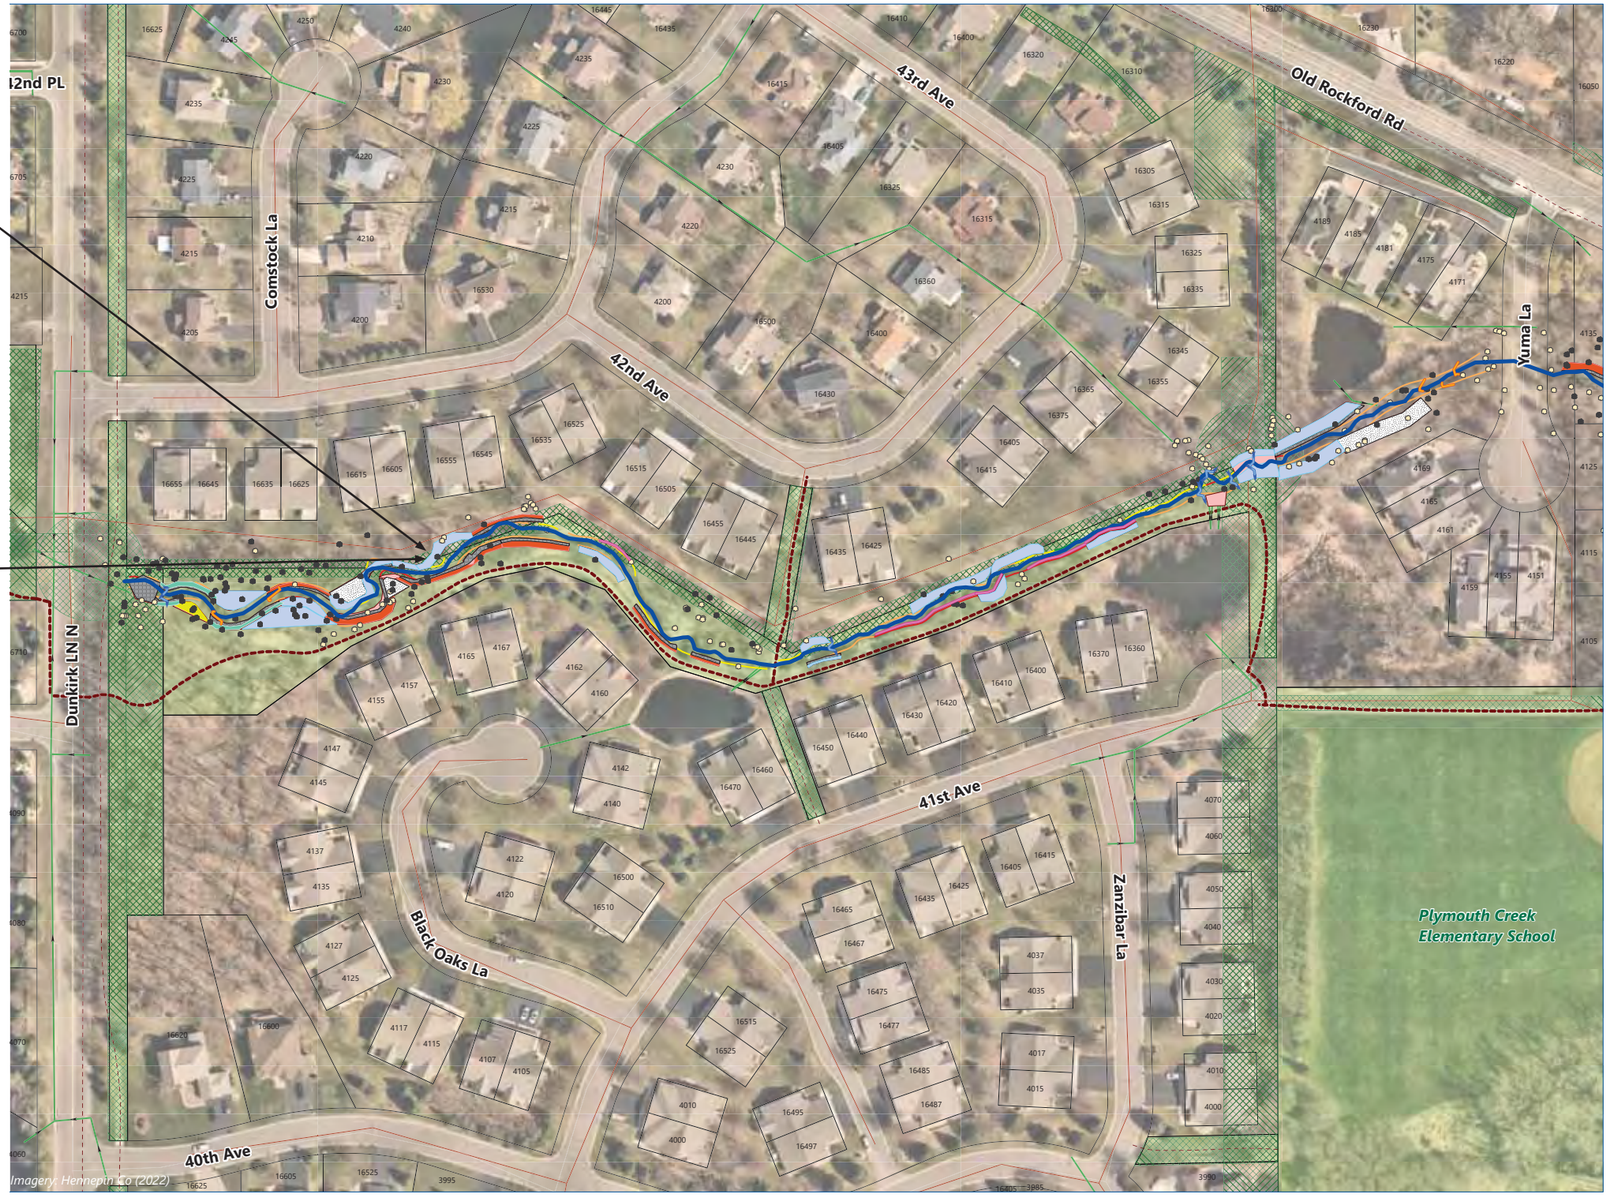
Benefits of Re-meandering

- Increases stream length and sinuosity
- Decreases flow rates and likelihood of bank erosion
- Increases resiliency during higher flow storm events
- Enhances habitat
- Promotes groundwater connectivity
- Enhances geomorphic processes including sediment transport and deposition



Preliminary Concept for Reach 1, Dunkirk Lane to Yuma Lane

- Regrade channel and stream banks to improve floodplain connection and soften tight curves
- Stabilize stream bank toe with rock riprap, coconut-fiber (coir) log, or root wads
- Stabilize stream bank with vegetative material (seed, live plugs, shrubs, and/or live cuttings)
- Remove invasive buckthorn within riparian zone and replace with native plantings



- Significant Trees
- Plymouth Creek
- Bike and/or Pedestrian Trail
- Parcel Boundary
- Public Parcel
- Easements

Bank Erosion Hazard Index (BEHI)

- Very High
- High
- Moderate
- Low

Utilities

- Gravity Storm Sewer

Plymouth Creek Restoration Project

Timeline, Funding, and Project Impacts

Timeline (watch for project updates!)

September 19, 2024 — BCWMC Public Hearing

Winter 2024-Spring 2025 — Project Design

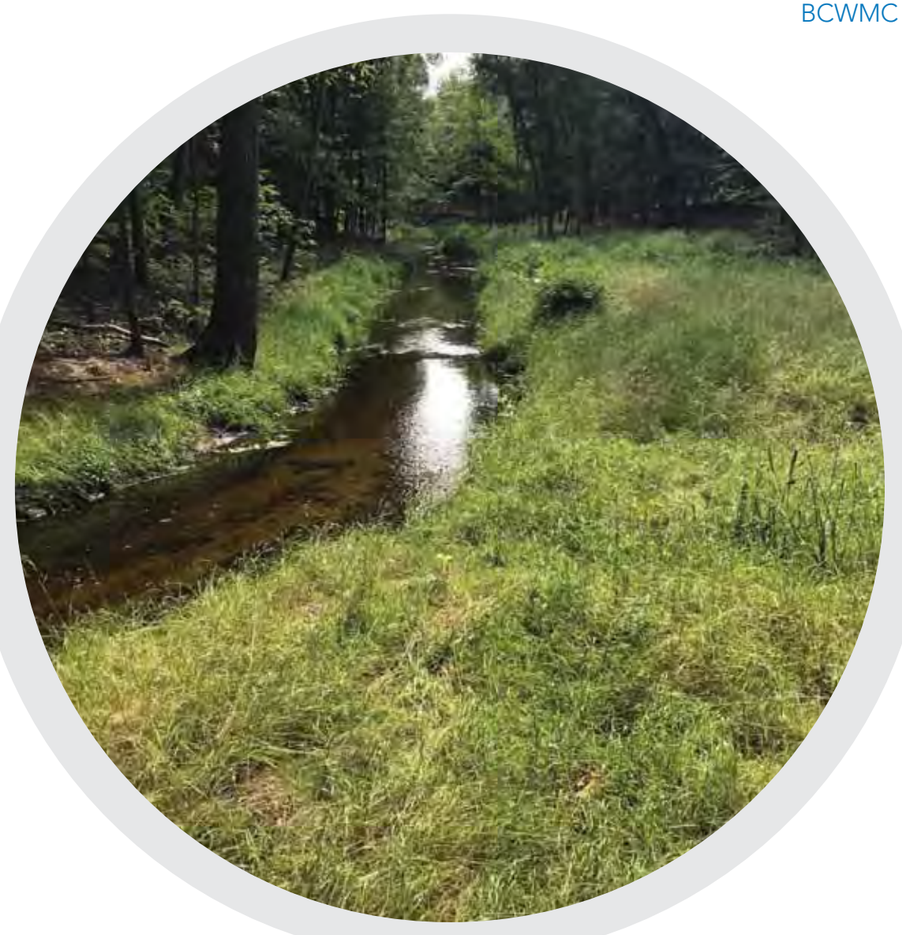
Spring 2025 — Contacting Individual Landowners

Winter 2025/2026 and Potentially Winter 2026/2027 — Project Construction

BCWMC Project Page

Funding

BCWMC Capital Funds levied by Hennepin County on all watershed residents



Project Impacts

- Improve water quality
- Reduce erosion along creek
- Improve in-stream and riparian habitat
- Protect infrastructure and utilities along creek
- Limit trail closures
- Limit tree removals or replace, as warranted

Plymouth Creek Potential Riparian Vegetation Regeneration Overview

Plymouth Creek riparian areas have lost much of their ecological value and stormwater runoff treatment capacity due to changes within the watershed. Regenerating native vegetation within the riparian zone of Plymouth Creek provides many opportunities to meet District goals including:

- **to restore ecological value**
- **to provide additional stormwater runoff treatment**
- **to clean up debris**
- **to restore wildlife habitat**
- **to provide passive recreation**

Understory and herbaceous ground layer species within the riparian corridor vary from non-native invasives (e.g., Tatarian honeysuckle, common burdock, thistles, and buckthorn) to native generalists (e.g., snakeroot, woodbine, Canada goldenrod, and asters). This plant community structure and species composition is a direct result of past human disturbance (e.g., plowing, grading, grazing, etc.).

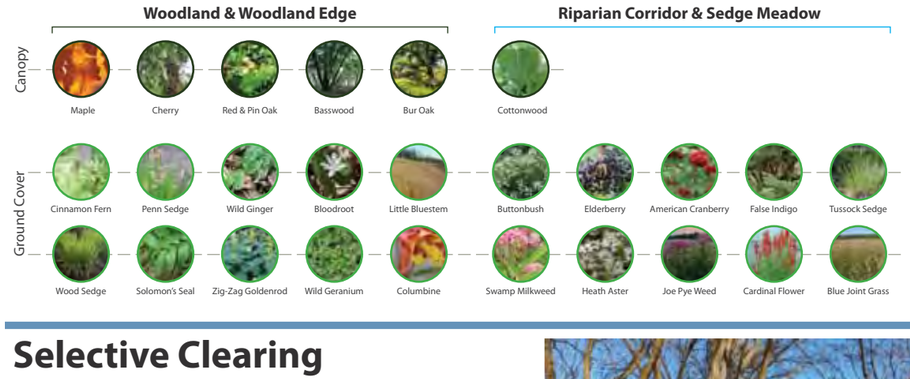
An invasive plant is defined as a plant that is non-native or native (e.g., Canada goldenrod, ragweed, and box elder) and has negative effects on our economy, environment, or human health. Invasive plants are aggressive species that can establish rapidly and outcompete native plants. When invasive species displace native plants they degrade wildlife habitat by altering the physical structural cover of a plant community and by eliminating essential food sources. Invasive species present along the creek, like buckthorn and garlic mustard, can create areas of exposed soils which lead to erosion and result in the degradation of water quality in lakes and streams. The removal of invasive species and the prevention of future species establishing is a project priority.

Existing Plant Community: **Plymouth Creek & Dunkirk Ln**

Existing Plant Community: **Plymouth Creek & Rockford Rd**

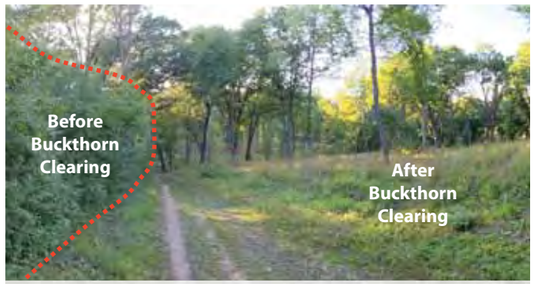
Existing Plant Community: **Plymouth Creek & 41st Ave**

Target Community



Example Target Plant Community: **Sedge Meadow**

Example Target Plant Community: **Sedge Meadow**



Example Target Plant Community: **Woodland**

Selective Clearing

Before re-introducing native plant communities, invasive and non-native perennial plants will be cleared. In addition, trees that are diseased, dying, and prone to infestation are to be identified for removal. Opening up the tree canopy allows for the reintroduction of the native plant communities that were once present. Trees targeted for tree removal include:

- Buckthorn
- Ash (emerald ash borer)
- Siberian elm
- Boxelder
- Dead or dying trees that may be a hazard

Plymouth Creek Riparian Area: **Existing Invasive Species**

Example of Tree Removal: **Forestry Mower Clearing Trees**

Example of Degraded Woodland Restoration: **Before**

Example of Degraded Woodland Restoration: **After**

How long will it take?

It can take 5-7 years for restored native plant communities to reach full maturity. Proper site maintenance following a planting is essential to reduce weed competition and ensure the success of the restoration project.

Year 1

The site will look bare and weedy during the first growing season. Cover crop grasses establish quickly (to stabilize soils) but native perennial plants may only grow to a height of six inches in a season. Mowing is the best way to control annual weeds during the first few years. Site mowing is typically done 2-3 times in the first year to prevent annual weeds from going to seed.

Example Woodland Restoration: **Year 1**

Year 2

Some of the short-lived flowering species bloom in abundance during the second year. Plants like wild bergamot, fragrant hyssop, and black-eyed Susan are usually the first to flower during restoration.

Mowing is generally limited to one or two times during the second year. Some herbicide spot spraying is anticipated for persistent woody invasive species.

Example Woodland Restoration: **Year 2**

Year 3 & Beyond

The composition and appearance of these planted communities will continue to fluctuate and evolve over time. Most native flowers and grasses begin to reach maturity during the third year.

The frequency of weed management activities will be reduced over time but continued management is going to be important for most restoration projects.

Example Woodland Restoration: **Year 3**

Cost Estimates

Plymouth Creek - Alternative 1, High Priority Sites

Item Description	Unit	Estimated Quantity	Unit Price	Extension
Mobilization	LS	1	$ 39,240	$ 39,300
Control of Water	LS	1	$ 20,000	$ 20,000
Erosion Control	LS	1	$ 16,770	$ 16,800
Clearing and Grubbing	ACRE	0.6	$ 21,500	$ 12,900
Clear and Grub Woody Invasive Plant Removal (<=6" DBH tree)	ACRE	3.4	$ 5,700	$ 19,400
Clear and Grub Woody Invasive Plant Removal (>=6" DBH tree)	EACH	5	$ 700	$ 3,500
Herbaceous vegetation herbicide treatment	ACRE	3.4	$ 1,000	$ 3,400
Select Tree Removal (>6")	EACH	121	$ 450	$ 54,500
Debris Removal	EACH	2	$ 1,450	$ 2,900
Grading	SY	2350	$ 3	$ 7,100
Common Excavation	CY	280	$ 16	$ 4,500
Fieldstone Riprap	TONS	390	$ 120	$ 46,800
Clear and Salvage Trees and Install as Root Wad	EACH	1	$ 700	$ 700
Cross Vane	EACH	11	$ 4,200	$ 46,200
J-hook Vane (boulder)	EACH	2	$ 1,300	$ 2,600
J-hook Vane (log)	EACH	4	$ 2,500	$ 10,000
Log Vanes	EACH	5	$ 1,750	$ 8,800
Brush Mattress	SY	150	$ 80	$ 12,000
VRSS	SY	240	$ 90	$ 21,600
Coir Logs	LF	110	$ 40	$ 4,400
Plant Trees	EACH	40	$ 300	$ 12,000
